

MULTIPLE SOURCES Lesson

INFORMATION FROM MULTIPLE SOURCES

Good readers find information from multiple sources. You can get information from books, magazines, newspapers, websites, visuals, and videos to help you answer a question or solve a problem.

Ask Yourself:

- What information does each source give?
- How is the information in both sources similar?
- How is it different?
- How can I use both sources together to learn more information?

Answer a Question

Where do American alligators live?

Source A

American Alligators

American alligators are crocodilian reptiles. American alligators are larger than other alligator species. Adult males measure 8 to 15 feet long and weigh up to 1,000 pounds. They live in the southeastern United States in freshwater wetlands from Texas to North Carolina.

Let's Practice!

Use the video clip, image, and passage to answer the questions.

Tutankhamun (sometimes called King Tut) was a Pharaoh of Ancient Egypt. He became Pharaoh at the age of 9. Tutankhamun is one of the most well known Egyptian kings. The discovery of his tomb in 1922 made him a celebrity. While many tombs of the past were robbed, this tomb was left virtually undisturbed. Most of the items buried with Tutankhamun have been well preserved, including thousands of precious metals and rare stones. The discovery of this tomb has allowed historians and archaeologists to see what some of the more important kings may have had in their burial chambers before they were robbed.

King Tut (c.1334-1323 BC)

Bones and More Bones The Skeletal System

The skeletal system is made up of all the bones in your body. It is also made of the things that connect your bones to each other: tendons, ligaments, and cartilage. The skeletal system also includes one set of hard objects that aren't bones: your teeth! Teeth are actually made of enamel, which is a substance that is even harder than your bones.

Skeletal System FUN FACTS!

- The thigh bone is the body's longest bone.
- Babies have more bones than adults.
- The collarbone is the most likely bone to get broken.
- There is only one bone in the body that isn't attached to any other bones: the hyoid bone.
